

R Comments

Comments in *R*

In *R*, comments are ignored during code execution. They are used to explain code, make it more readable, or temporarily disable lines during testing.

Single-Line Comments

Any text following a `#` symbol is treated as a comment. *R* will ignore everything from `#` to the end of that line.

Example

```
# This entire line is a comment
"Hello World!"

"Hello Constant!" # This is an inline comment
```

Multiline Comments

Unlike other programming languages, *R* does not have a syntax for multiline comments.

To create a multiline comment, add a `#` at the beginning of each line.

Example

```
# This is a multiline comment
# spanning across multiple lines
# to explain complex logic.
"Hello World!"
```
