

R If...Else Basics

Comparison Operators

R supports different comparison conditions from mathematics, such as:

Operator	Name
<code>==</code>	Equal
<code>!=</code>	Not equal
<code>></code>	Greater than
<code><</code>	Less than
<code>>=</code>	Greater than or equal to
<code><=</code>	Less than or equal to

These comparison operators evaluate expressions and return a boolean value (`TRUE` or `FALSE`), which is most commonly used in "if statements" and loops.

The If Statement

An "if statement" is written with the `if` keyword, and it is used to specify a block of code to be executed if a condition is `TRUE`.

Example

```
a <- 33
b <- 200

if (b > a) {
  print("b is greater than a")
}
```

R uses curly brackets `{ }` to define a block of code.

Else If

The `else if` keyword specifies a secondary condition to evaluate if the preceding `if` condition evaluates to `FALSE`.

Example

```
a <- 33
b <- 33

if (b > a) {
  print("b is greater than a")
} else if (a == b) {
  print("a is equal to b")
}
```

If Else

The `else` keyword catches anything which isn't caught by the preceding conditions.

Example

```
a <- 200
b <- 33

if (b > a) {
  print("b is greater than a")
} else if (a == b) {
  print("a is equal to b")
} else {
  print("a is greater than b")
}
```
